LED CAR LAMP

FUTURE LIGHTING SOURCE

LED is one type of low-fielded electricity device that sends semiconductor and gives out light and it emerges rapidly in recent years. Such green lighting solid of light will become one of future lighting sources in the 21st century soon. It has advantages such as energy-conservation, long life-span, non-maintaining, explosion-proof, apt to controlling and eco-environment, etc. It has its own unique feature of cold light, so it could protect the appearances of the lamps and lanterns from being out of shape after being heated for a long time.

The reaction time of LED brake light will be 80ns quicker than traditional incandescent lamp, so as to increase safe distance of 4-6 feet on the expressway.

At present, high-power LED has already been used for car's lighting in a large amount, especially for the car taillights. LED will occupy the majority of taillight lighting by 2010.
